

Basic Sales Summary

Retail Sales Analysis using Microsoft Excel
Data Analytics Track · Level 1 · Task 14

Prepared by: Akshat Srivastava

1. Objective

Build a basic business summary from retail sales data by calculating total sales, average sales, and the number of transactions using Excel formulas.

2. Dataset Overview

The dataset contains **200** retail transactions recorded between **01 Jan 2026** and **31 Aug 2026** across 5 stores (Lucknow, Delhi, Mumbai, Bengaluru, Kolkata) and 4 product categories (Electronics, Clothing, Grocery, Home & Kitchen). Each record holds the transaction ID, date, store, category, product, quantity, unit price, payment mode and sales amount (Quantity × Unit Price). This is a sample dataset prepared for practice.

3. Key Performance Indicators

TOTAL SALES	AVERAGE SALES	TRANSACTION COUNT
₹5,60,994	₹2,804.97	200

KPI	Excel Formula	Result
Total Sales	=SUM('Retail Sales Data'!I2:I201)	₹5,60,994
Average Sales	=AVERAGE('Retail Sales Data'!I2:I201)	₹2,804.97
Transaction Count	=COUNTA('Retail Sales Data'!A2:A201)	200

Verification: ₹5,60,994 ÷ 200 = ₹2,804.97. The totals were also cross-checked manually using Excel's status bar (Sum, Average, Count).

4. Detailed Breakdown

Category	Sales	Share	Store	Sales	Share	Payment	Sales	Share
Electronics	₹1,91,548	34.1%	Bengaluru	₹1,46,250	26.1%	UPI	₹2,10,279	37.5%
Home & Kitchen	₹1,88,505	33.6%	Delhi	₹1,06,587	19.0%	Card	₹1,76,777	31.5%
Clothing	₹1,51,128	26.9%	Lucknow	₹1,06,283	18.9%	Cash	₹1,73,938	31.0%
Grocery	₹29,813	5.3%	Kolkata	₹1,02,023	18.2%			
			Mumbai	₹99,851	17.8%			

5. Visual Analysis

6. Key Insights

- Total sales of **₹5,60,994** were generated across **200** transactions, with an average of **₹2,804.97** per transaction.
- **Electronics** is the top category (₹1,91,548, 34.1% of sales), closely followed by **Home & Kitchen** (₹1,88,505).
- **Grocery** contributes only 5.3% of sales, as its items have a much lower unit price.
- **Bengaluru** is the best-performing store (₹1,46,250), while **Mumbai** is the lowest (₹99,851).
- **UPI** is the most used payment mode (37.5% of sales).
- Monthly sales were highest in **May** (₹97,884) and lowest in **February** (₹46,922).

7. Methodology

1. Opened the retail sales dataset in Excel.
2. Created a new sheet named **Summary** for the KPIs.
3. Applied SUM, AVERAGE and COUNTA formulas on the Sales Amount and Transaction ID columns.
4. Verified totals manually using the status bar and the check $\text{Total} \div \text{Count} = \text{Average}$.
5. Formatted the sheet (currency, bold headers, column widths) and added a written summary.

8. Conclusion

The summary gives a quick snapshot of business performance. With ₹5,60,994 in total sales and an average order value of ₹2,804.97, the business is driven mainly by Electronics and Home & Kitchen products. Simple formulas like SUM, AVERAGE and COUNTA are enough to turn raw transactions into meaningful KPIs.

Tools Used: Microsoft Excel (SUM, AVERAGE, COUNTA, formatting)
